Mechanics 1 Kinematics Questions Physics

Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include acceleration (a), time (t), displacement (d), final velocity (vf), and initial velocity (vi). If values of three variables are known, then the others can be calculated using the equations.

Equations of Motion. Okay, enough of the definitions. Let's see how these things all fit together, and how they can be used. What we will be looking at are called the equations of motion, and this topic is often referred to as kinematics. It is important to note that we are not yet dealing with causes for these motions, but only the motions themselves.

Mechanics can be divided into 2 areas - kinematics, dealing with describing motions, and dynamics, dealing with the causes of motion. In Physics 1, we try to "cover" mechanics in 1-4.5 week cycle. Obviously, lots of things are going to get left out or glossed over, but turning out mechanical engineers is not the goal in Physics 1!

Figure 5.1.1 - Motion of Two Points on a Rotating Rigid Body. Drawing a straight line from the fixed point (called the pivot) to two different points on the object, we see that the angles through which these straight lines sweep are the same, and indeed this is true for every point on the object. So as we talk about rigid body rotation, our ...
